Version Management: What and Why

- Manage multiple revisions of code
 - Individually project (rare) or collaborative in a team
 - Develop independently, merge consistently, maintain consistent revisions
- Can be used for documents, reports

git versus svn

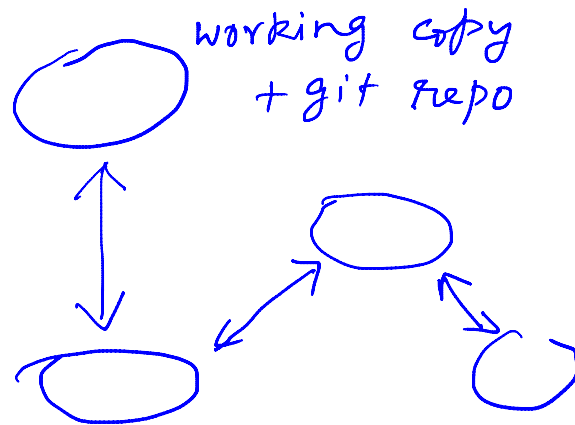

- svn:

- Needs a central repository
- Separate from working copy

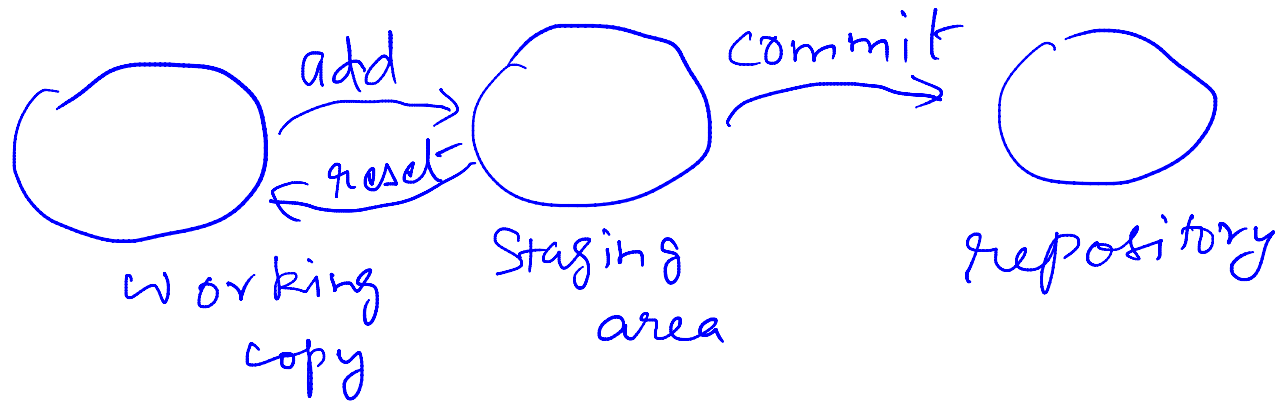

- git:

- Each working copy has a full git repository
 - Each user can work and manage revisions independently
- User can interact with other users independent of central repo.

Creating a (local) git repository:
`git init`

git add, status, commit, reset

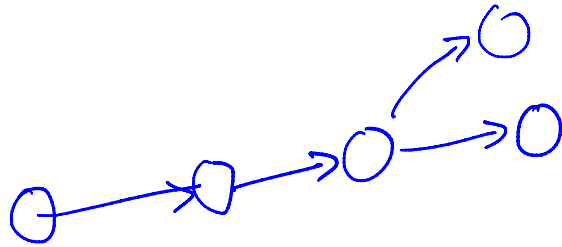

Using .gitignore

```
git log
```

`git revert`

`git checkout`

git branch, merge

Using gitk

Remote repository:
`clone, pull, fetch, push`

Other git commands: tag, config
